The First Self Mining Smart Contract
Roadmap
2017

1. **Introduction**

   Now that minereum is deployed on the Ethereum network we are focusing on the next steps of this project.

   The roadmap for minereum will focus mainly on the creation of exclusive services and marketing.

2. **Services**

   Our team is working on the conceptualization of various services.

   All the services provided by the minereum team will only accept minereum as its currency and all the received tokens from purchases will be destroyed.
   The method of destroying minereum tokens will be public and verifiable, once destroyed they will not be spendable and therefore they will be out of circulation.

   Some of the services we are conceptualizing:

   · Automatic Ethereum Token Creation Service
   · Creation of Ethereum Tokens with exclusive minereum mining processes
   · Other Services

2.1 Ethereum Token Creation Service

To start we are planning to release our first service called *Ethereum Token Creation Service*. This will be the First Automatic Ethereum Token Creation Service ever created. An illustration of the service can be visualized below:

minereum
transaction

Ethereum Token Creation Service

1. deploy token on the
ethereum network

2. destroy the received
minereum tokens

We believe that Ethereum Tokens should be created by anyone anytime anywhere without any hustle.

This service will allow anyone to create an Ethereum token (fully ERC20 compatible) with a simple minereum transaction, there won't be any technical knowledge or installation of additional tools required.

The user will simply input the desired supply, Token Name, Symbol and other basic information and the Token will be automatically coded, compiled and deployed on the ethereum network.

All created tokens will be sent to the originator of the transaction or to multiple addresses if desired by the user.

Ethereum Tokens can be created for a variety of reasons:

- · To create an ICO
- · Add it to an Exchange
- · Trade them among friends
- · Private use
- · Etc.

2.2 Creation of Ethereum Tokens with exclusive minereum mining processes

The idea will be to create additional Ethereum tokens that require minereum for its core mining process. More information will be provided on a later stage, to start we will focus only on the Ethereum Token Creation Service.

2.3 Other Services

We are exploring other services and we are also listening to the community for other service proposals. Community related ideas include:

- · Creation of an exclusive minereum Lottery
- · minereum Faucets

3. Marketing

The minereum marketing activities will include:

- · Direct Advertisement on Cryptocurrencies related websites
- · Twitter campaigns
- · Translation of the minereum main thread to all main languages
- · Other options to be considered
